

Grow Guide

Butterfly Pea

Butterfly pea can be direct seeded or transplanted with success. It is a heat loving species that grows well in the 9 warmest months of the year in Florida. Rampant vines require a trellis such as a fence or bamboo poles. The bulk of the pod production seems to be in the fall, indicating this species may have daylength sensitive flowering habits. This is an extremely problem-free, easy to grow plant. Plants perform well in full sun or dappled shade.
